

Version 3.0 February 26

Software Plans

The Dustlight Software is the digital backbone of the Dustlight ecosystem. It enables customers to monitor, analyze, and manage dust exposure data collected by Dustlight devices both in real time and over longer periods.

Without the software, Dustlight functions as a standalone measuring device. With the software, it becomes a scalable management and compliance solution that supports occupational safety, air quality improvement, and structured reporting in professional environments.

Dustlight offers three software plans: **Basic**, **Business** or **Corporate**. To select the software plan, it is important how the Dustlight system is intended to be used.

Basic Plan

The Basic plan is the default starting point for all users and is intended for simple, individual use. Measured values can be displayed live in the mobile app and exported directly as raw data. All measurement data is stored locally on the smartphone, meaning it remains accessible even when the phone is not actively connected to the Dustlight device. This means the phone acts as the only storage location for measurement history.

As a result, Basic is suitable for testing or personal use, but it has clear limitations in professional environments. There is no centralized backup, no multi-device access, and no web-based evaluation. If the phone is lost, damaged, or replaced without backup, measurement data may no longer be accessible.

Business Plan

The Business plan is designed for professional use in teams and is primarily defined by access to the Dustlight Cloud. After synchronization, all measured values are automatically stored in the cloud. This prevents data loss, reduces smartphone storage limitations, and provides unlimited cloud-based storage.

A vital part of the Business plan is the Dustlight Web App, enabling convenient visualization and evaluation on larger screens. In addition, advanced exposure

monitoring features such as Short-Term and Long-Term Exposure Limits (STEL & TWA) and event tracking are included. The plan also provides access to material-specific configurations such as wood dust, welding fumes, silica, or oil mist.

Overall, the Business plan offers the core set of features required by most industrial and occupational safety customers and is suitable for most small to medium sized enterprises.

Corporate Plan

The Corporate plan is intended for larger organizations with more complex structures and higher requirements for centralized oversight. In addition to all Business features, it provides long-term analytics of dust exposure across teams and comprehensive fleet management.

In the Corporate plan, measurement data becomes accessible across multiple devices and users within the organization. Organizations can create and manage teams, define roles and hierarchies, and share measurement data across departments or sites.

Admins gain a central overview of all Dustlight devices and can evaluate exposure data across the entire organization.

The Corporate plan enables efficient company-wide management and reporting, making it especially relevant for enterprise customers with many users, multiple locations, and ESG or compliance-driven reporting needs.

* To connect directly to a Dustlight, you need a Mac, Windows or Linux PC with an up-to-date Edge or Chrome browser, as well as at least a Bluetooth 4.2 interface.

** Access to all available material configurations can be booked at additional cost

	Basic Plan	Business Plan	Corporate Plan
Use of the app for iOS and Android	✓	✓	✓
Local data storage on the mobile phone	✓	✓	✓
